API Research

API Options

The RESTful Pokémon API

Description

The PokéApi is a database containing a variety of information about the main Pokémon videogame series. This information includes details about Pokémon, their moves, abilities, held items, locations etc.

Requirements

The API does not have any authentication and can only be accessed with the HTTP GET method.

Limitations

There are no requests limits, however the API's admin ask to abide by their fair use policy, notable to locally cache resources after requesting them to keep their hosting costs low.

Notes

The API allows for a lot of elements to be compared, however to improve on the example shown, I will be catering to the competitive side of the Pokémon fandom. This includes highlighting/comparing the selected Pokémon's move pool, abilities, base stats and nature's affection.

Link: https://pokeapi.co/

The Persona Compendium API

Description

The Persona Compendium API contains information about all the persona's in the Persona 3 Reload video game. The API was made by Github user luyuish, giving a deeper view of how API's are built. The API allows information like Persona's images, stats, resistances etc.

Requirements

The API is read-only and can only be accessed with the HTTP GET method. No authentication is needed.

Limitations

No noteworthy limitations were mentioned in the Read Me, except for the BSD-3-Clause license about how the API may be used.

Notes

The API is well documented and very straightforward allowing me less headache on setting it up and more time on crafting a better application.

Link: https://github.com/luyluish/persona-compendium

The TEMTEM API

Description

The Temtem API's database contains information about the creatures from the video game with the same name. These Tems have unique stats, natures, weaknesses, locations etc. The API was made by Github user maael and pulls information directly from the official Temtem Wiki.

Requirements

The API is read-only and can only be accessed with the HTTP GET method. No authentication is needed.

Limitations

No limitations were mentioned in the READ Me or official website, so self regulation must be implemented.

Notes

The PI is heavily inspired by Pokémon and thus shares a lot of the similar information, but on a smaller scale. However the API still has the same level of depth of data.

Link: https://temtem-api.mael.tech/

Chosen API () => TEMTEM API

The Temtem API provides a deep data set, with a more manageable amount of unique objects(Tems) compared to for example the Pokémon API.

Temtem is also a lesser known PI, this adds to the challenge of designing an interesting web app that can compete with a more successful PI. The API also has enough unique information to stand apart from other PIs and their APIs.

My approach is to lean into providing more details about each unique Tem, allowing for a deeper understanding of the PI and it's data.

Endpoints

https://temtem-api.mael.tech/api/	Root.
(Root)/temtems	Returns a list of all the Tems, this includes their stats, images, moves etc.
(Root)/temtems/(1-165)	Returns a specific Tem's stats, images, moves etc.
(Root)/traits	Details of a Tem's passive abilities, as the [/temtems] only mentions the traits, but not it's description.
(Root)/techniques	Describes a Tem's moves, as the [/temtems] only mentions the moves.
(Root)/weaknesses	Breaks down which types are weak against other and how damage is effected by these values.

JSON Structure

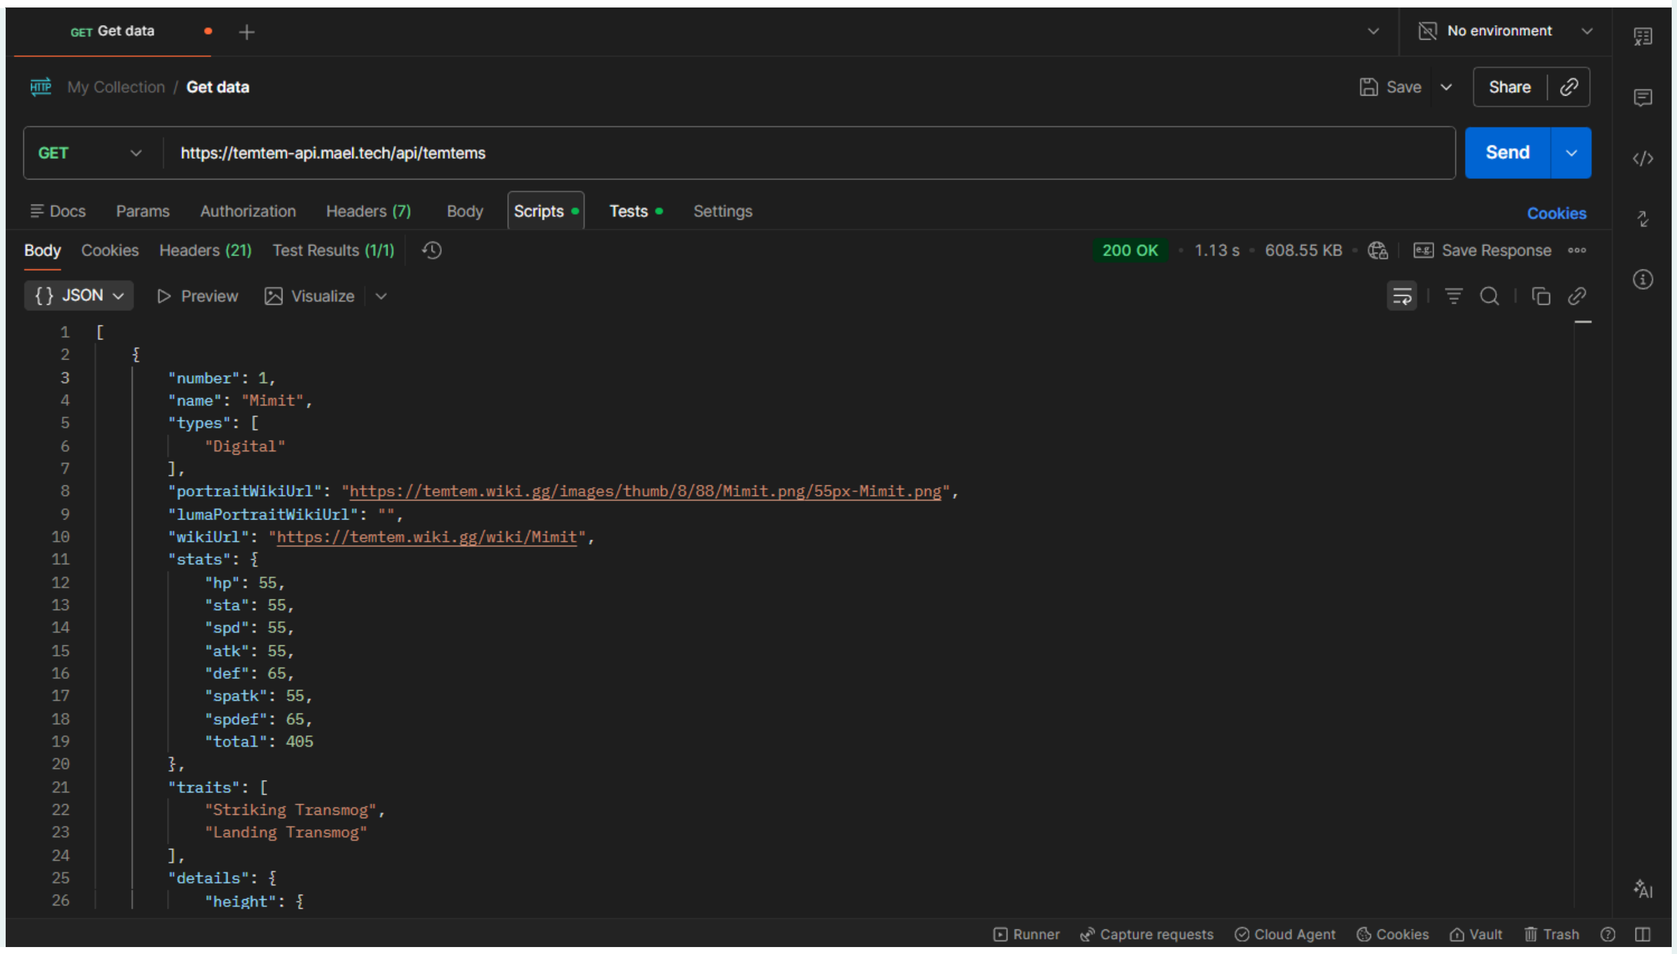

Below is the basic structure of a Tem as received from the API, I marked the usable data in green.

number	1

gameDescription	Mimit has the honor of being the very first Digital ever created. The genomic reservoir contained in its tail allows it an unequalled ability to replicate any other Temtem species, making it the ultimate breeder.

coolors

Logo Design

-Used claws to represent the T's in Temtem and support the creature motive and to create an interesting eye shape.
-Added a magnifying glass, that doubles up as a creature nose and splits the bottom of the circle creating a smile.
